# Hizkia Informatique - Ibaï Begi - SICAAV

## Vidéo Counting Systems

- Ibaï Begi: Fish pass counting with uni/multi camera system
- SICAAV: Eel and Elver counting on a ramp

Currently running on 25 sites

## 6 What's Next

# Goal

Build a fish recognition tool to improve fish tracking and sequence refinement to facilitate migratory studies.

- Detect and recognize fish species in a fish pass without missing any big migratory species,

# Goal

Build a fish recognition tool to improve fish tracking and sequence refinement to facilitate migratory studies.

- Detect and recognize fish species in a fish pass without missing any big migratory species,
- Work with lighter model as the solution could be embedded to do on-site detection,

# Goal

Build a fish recognition tool to improve fish tracking and sequence refinement to facilitate migratory studies.

- Detect and recognize fish species in a fish pass without missing any big migratory species,
- Work with lighter model as the solution could be embedded to do on-site detection,
- Improve the counting tool and his UI to synergize operators checking and data improvement.

## 6 What's Next

# Challenges

- Complexity of imagery (water quality, multiple output systems, fish similarities...) that defers from one site to another,

# Challenges

- Complexity of imagery (water quality, multiple output systems, fish similarities...) that defers from one site to another,
- Utilize/adapt state of the art object detection/recognition systems,

# Challenges

- Complexity of imagery (water quality, multiple output systems, fish similarities...) that defers from one site to another,
- Utilize/adapt state of the art object detection/recognition systems,
- Work in cooperation with migratory study associations to understand their need and facilitate their work,

# Challenges

- Complexity of imagery (water quality, multiple output systems, fish similarities...) that defers from one site to another,
- Utilize/adapt state of the art object detection/recognition systems,
- Work in cooperation with migratory study associations to understand their need and facilitate their work,
- Deploy the new tool on each video counting system Hizkia has.

# Performance Comparison

Figure 9: Object detection Benchmark

# YOLO

## Why Yolov5 ?

- Fastest state of the art object detection network(Yolo5 can operate at 100fps with 52% AP with V100)

# YOLO

## Why YOLOv5 ?

- Fastest state of the art object detection network(YOLOv5 can operate at 100fps with 52% AP with V100)
- Small Weight(14MB before pruning for YOLOv5small)

# YOLO

## Why YOLOv5 ?

- Fastest state of the art object detection network (YOLOv5 can operate at 100fps with 52% AP with V100)
- Small Weight (14MB before pruning for YOLOv5small)
- At equivalent speed YOLOv5 has better accuracy ( +5% mAP than EfficientDet at same FPS)

## 6 What's Next

# Raw(-ish) Data

3 years of video counting from different sites, with fish count and taxon information.

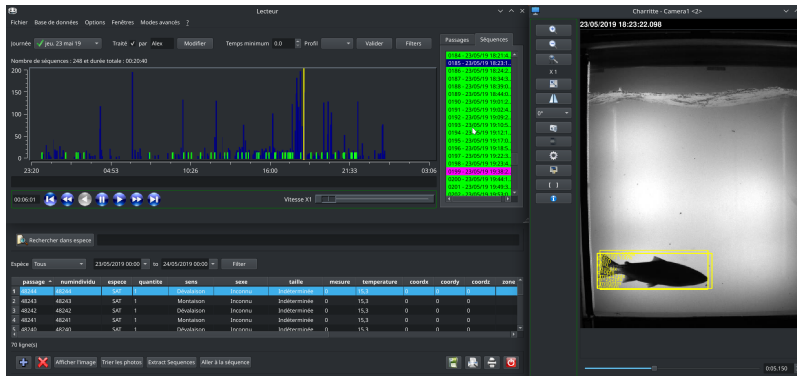

Figure 10: Video counting software

# Labeling the data

**Problem :** The lack labeled data

We can extract the image + labels as *.txt* from the bounding boxes drawing tool embedded in App

### Results

### Discussed Client Needs

## 6 What's Next

# Results

## Best Results on YOLOv5s

- Trained on 100 epochs
- 30 unchanged hyperparameters from Ultralytics
- With first dataset we can obtain a 83% accuracy
- Achieved inference time: 8.8ms

# Results

## 5 Results and Discussions

Results

Discussed Client Needs

## 6 What's Next

# Needs

## Feedback

- *"We have no need for automatic recognition" ~ Migradour*
- *"Automatic recognition could able us to focus on more interesting things" ~ Migado*

## Actual Needs

- Filter out video with uninteresting information
- Rely totally on the tool, or only verify unique set of labeled fishes
- do not miss any migratory species

# Data to take into consideration

What do professionals look for while stripping data

## Help for classification

- Seasonality
- Fish coat (can vary from regions and seasons)
- Multiple taxon instances
- Swim technique

- 1 Presentation
- 2 Motivations
- 3 Approach to Object Detection
- 4 Data & Tools
- 5 Results and Discussions
- 6 What's Next

# What's Next

- Add more labeled data do the dataset(research has shown that we need at least 500 instances of each class to have the best improvement in accuracy)

# What's Next

- Add more labeled data do the dataset(research has shown that we need at least 500 instances of each class to have the best improvement in accuracy)
- Pruning the model and test if model can be ran on real time with machine on site

# What's Next

- Add more labeled data do the dataset(research has shown that we need at least 500 instances of each class to have the best improvement in accuracy)
- Pruning the model and test if model can be ran on real time with machine on site
- Binaries eels images from SICAAV, this could improve detection precision

# What's Next

- Add more labeled data do the dataset(research has shown that we need at least 500 instances of each class to have the best improvement in accuracy)
- Pruning the model and test if model can be ran on real time with machine on site
- Binaries eels images from SICAAV, this could improve detection precision
- Implement a dashboard to have direct results of detection. The idea is to produce a mosaic of images with fish and their class. The operator will only have to validate each image and their classification.

# Merci!
